DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1 and 2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Young (US Pat 7,011,658) in view of Nicosia et al. (US Pat 6,729,515)

Regarding Claim 1: Young teaches a device with two tubular pin holders (Figure 5 Elements A_1 and A_2) connected to a parallel guide system (Figure 5 Element 30), and can have two pins (Figure 5, two threaded elements in direct contact with V_1 and V_2).

Young does not teach a device where at least one pin holder has a locking device. Nicosia et al. discloses a latching assembly/locking device with at least one transverse groove (Figure 8, the area between Elements 105 and 50) and a hook portion/locking finger (Figure 11 Element 67) that is able to move from a locked position and a release position (Figure 14 and Figure 10, respectively). Young and Nicosia et al. are analogous art because they are concerned with a similar technical difficulty, namely a means of fastening. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use the Nicosia et al. locking mechanism in the Young bone device. The motivation would have been to offer an equivalent and alternative means of securing the tubular pin in place (see MPEP § 2144.06).

Art Unit: 3709

Regarding Claim 2: Young teaches a similarly claimed device as explained in Claim 1. Young does not teach a device in which the locking finger is designed like a hook that is mounted at the open end of a pin holder and is movable around an axis. Nicosia et al. discloses a latching assembly/locking device with a hook portion/locking finger (Figure 11 Element 67) mounted at the end of the threaded stud/pin holder (Figure 9 Element 89) that is movable about an axis. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to combine Young's bone device with Nicosia et al.'s locking mechanism. The motivation would have been to offer an alternative means of fastening the pin in place (see MPEP § 2144.06).

Correspondence

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Alexis M. Wistermayer whose telephone number is 571-272-1197. The examiner can normally be reached on Monday - Friday 8 am - 4 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Eashoo can be reached on 571-272-1197. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
